WINDOWS 8 – REALLY A BETTER OPTION?

Launched in October of 2012, the latest version of Windows showcases what seems to be a full re-design of what we have come accustomed to. However, upon closer inspection one could easily find a fair amount of resemblance to Windows 7.

Windows 8 has seen Microsoft take a radical new approach to Touch Screen enabled computers/devices. For the first time ever, the operating system features an application store, similar to what one might find on Apple Mac devices/computers and Android devices. The store allows the downloading of (free and licensed) software/applications via the portal hosted by Microsoft. The operating system also features a new look, boasting “live” tiles on its Home Screen. These tiles can be linked to contacts, or your contact’s Facebook status, to the latest news, or weather forecasts, and many more.

Still, with its entire prowess, one must understand that the operating system is still very immature in the sense of security and vulnerability. Windows 7 offers a vastly more stable and secure solution at this present moment, mostly because it’s been around for longer, and that it has gone through the baby steps . It has had several updates, security- & hotfixes, as well as a Service Pack. These updates all contribute to a more secure and stable operating system.

It is this reason that compels IT to still choose Windows 7 as our supported operating system - used campus-wide. Thus, we roll out all new computers with Windows 7 installed. Any PC/device that is work-related, will either be upgraded (older Win XP PC’s) OR downgraded (some new PC’s ship with Windows 8) to Windows 7 with Service Pack 1.

***** Side note**

The IT team is already testing Windows 8 and its customisations for future use on campus. This is a tedious task, necessary to facilitate a secure and trusted environment for all our colleagues.
